

For the Frontend Developer

You are building the entire user experience. Your work is what the judges will see and interact with.

- **Today (Sep 17):**
 1. **Install Environment:** Install **Node.js** and **VS Code**.
 2. **Setup React Project:** In your terminal, run `npx create-react-app ayurveda-tracker`.
 3. **Build UI Components (with fake data):**
 - Create a `components` folder.
 - **CreateBatchForm.js:** Build a simple HTML form with input fields for "Farmer Name" and "Location," and a "Submit" button.
 - **BatchHistory.js:** Create a component that displays herb batch details (ID, Farmer, Location, Timestamp). For now, just hardcode the data so you can perfect the layout.
 4. **Set up Pages:** Use the components to create two main pages in your app.
- **Tomorrow (Sep 18):**
 1. **Install Axios:** In your project terminal, run `npm install axios`.
 2. **Connect to Mock API:**
 - In `CreateBatchForm.js`, write the `onSubmit` function that uses `axios.post()` to send the form data to the Backend Dev's mock API URL.
 - In `BatchHistory.js`, use `axios.get()` to fetch the fake data from the mock API and display it. This ensures your data-fetching logic is working before the backend is even finished.
- **Sep 19 - 20:**
 1. **Final Integration:** The backend API should now be connected to the real smart contract. Your job is to test the full end-to-end flow. Submit the form, see the transaction happen, and then fetch the data to display on the history page.
 2. **Polish and Refine:** This is your time to shine. Clean up the UI, add loading indicators, handle errors gracefully (e.g., show an alert if the transaction fails), and make the prototype look as professional as possible.
